Blood Donors Community

Why Donate Blood?

Donating Blood Saves Lives
Consider the individuals in the hospital needing a blood transfusion. A gunshot or accident victim. Any person needing an ample supply of blood while in surgery. These people need us, and what they ask for is very little. Just imagine what a few pints of blood can do and how many lives it can save.

Donating Blood Increases Your Own Awareness of Cholesterol Levels
One of the added benefits of donating blood is having access to cholesterol levels. Results are readily available to you online so you can gauge what you need to change in your diet, or you may just want to maintain healthy levels.

The Health Benefits from Donating Blood
Donating blood has many health benefits. Not only will you help someone in need of blood, but you will also help optimize your health and wellness. Here are the top three health benefits from donating blood.

1. Protect Your Heart by Reducing Oxidative Stress

Iron in your blood can oxidize resulting in damage to your cells and tissues. The increase in oxidative stress is most dangerous to your cardiovascular system.

According to a new study published by the American Medical Association, giving blood every six months led to fewer heart attacks and strokes in test participants ages 43 to 61.

Excessive iron is thought to contribute to heart disease, especially at its early stages. Donating blood on a regular basis reduces the iron stores in the body and this study supports the theory that reducing iron appears to preserve cardiovascular health.

A second study of 2,682 men in Finland, reported in the *American Journal of Epidemiology*, found that men who donated blood at least once a year had an 88 percent lower risk of heart attacks than non-donors.

This same group of researchers published a follow-up study and found that men who donated blood were less likely than non-donors to show any signs of cardiovascular disease.

2. Protect Against Developing Cancer

Give blood to help lower your risk of cancer. According to the Miller-Keystone Blood Center, consistent blood donation is associated with lowered risks for cancers including liver, lung, colon, stomach and throat cancers.²

Risk levels dropped in correlation with how often participants donated blood. The association between lower cancer risk and donating blood might also stem from reducing oxidative stress. Free radical compounds can damage your DNA. Damaged genetic material is the hallmark of all cancers.

3. Free Blood Analysis

After donating, your blood will be tested for syphilis, HIV (the virus that causes AIDS), hepatitis and other factors. The center will notify you if tests show you may be unhealthy. Your blood will not be used if it could make someone sick.

Blood Requester Home page.

The screenshot shows the home page of the 'Blood Donors Community' website. At the top, there is a dark red navigation bar with links: 'Login', 'Blood Request', 'Request For Blood', and 'About Donation'. Below this, a light red banner features a cartoon blood drop character on the left and the text 'Blood Donors Community' in the center. A dropdown menu is visible under 'Blood Request', showing options: 'All Request List' and 'Edit Request'. Below the banner, there is a yellow box with the heading 'Why Donate Blood?'. It contains two sections: 'Donating Blood Saves Lives' and 'Donating Blood Increases Your Own Awareness of Cholesterol Levels', each with a brief paragraph of text.

Here Blood Requester After Register Can login here.

The screenshot shows the 'Requester Login' page of the 'Blood Donors Community' website. It features the same dark red navigation bar and light red banner with the cartoon blood drop character and 'Blood Donors Community' text. Below the banner, there is a white box with the heading 'Requester Login'. Inside this box, there are two input fields: 'Email:' and 'Password:'. Below these fields is a 'Login' button. The page is framed by a light gray border.

Here Requester can make a request.

INTRODUCTION

The number of persons who need blood are increasing in large number day by day. In order to help people who, need blood, my Online Blood Bank can be used effectively for getting the details of blood donors having the same blood group and within the same city. With the help of my Online Blood Bank people who are having the thought of donating blood gets registered in my Online Blood Bank giving his total details.

My Online Blood Bank site is available to everyone easily. A person who likes to donate blood gives his entire details i.e., fill in the registration form and can create a username with a password by which he can modify his details if at all there are any changes in his information given before.

My site also helps people who are in need of blood by giving the details of the donors by searching, if at all there are no donors having the same group and within their own city they will be given the addresses with phone numbers of some contact persons in major cities who represent a club or an organization with free of cost. If at all the people find any difficulty in getting blood from the contact persons we will give them a Mobilink i.e., India's Largest Paging Service number through which they can give the message on every ones pagers with the blood group and city they are living in, such that the donors who view the messages in their pagers having the same blood group and the in the same city, he contacts the person on phone who are in need of a blood. Such that the person gets help from us which saves his life.

Purpose of the Project:

Online Blood Bank is aims serving for human welfare. We have all the information; you will ever need. Many people are here for you, to help you, willing to donate blood for you anytime. We have done all the job, rest is yours. search the blood group you need.

You can help us by registering on Online Blood Bank if you are willing to donate your blood when needed. As a proud member of Online Blood Bank and a responsible human being, you can help someone in need. So, donate blood in online.

Modules:

1. Login
2. Registration
3. Admin
4. Donor or User
5. Make a Blood Request from Admin
6. About Blood Bank
7. Feedback

1. Admin: This module focuses on the both donors & acceptors. Each member in a donor & acceptor is given a user id and password, which identifies him uniquely. The member is given a login form. he enters the login details user id and password. The options given to

- Change Password
- Maintain donor details
- Maintain referral once
- Update donor details
- View Donor List by Group wise
- Approve the Donor or delete the Donor
- Logout

Whenever a user wants to change his / her password he can select the change password option. The system displays the form, which asks him for his old password and new password. The system then compares the old password with the existing password in the database and if they match then the password is set to the new password in the database. The id for retrieving the details from the database is brought through the session, which is maintained using cookies in the form. This removes the burden on user in typing user id

again and maintains security by not allowing one user to change password of other accidentally.

2. Donor:

Each member in a Donor is given a user id and password, which identifies him uniquely. The member is given a login form. he enters the login details user id and password. The options given to each member in a staff are

- Change password
- Find a Blood group.
- Edit Profile
- Find A Donor.
- Donate a Blood to patient
- Logout

Whenever a user wants to change his / her password he can select the change password option. The system displays the form, which asks him for his old password and new password. The system then compares the old password with the existing password in the database and if they match then the password is set to the new password in the database. The employee id for retrieving the details from the database is brought through the session, which is maintained using cookies in the form. This removes the burden on user in typing user id again and maintains security by not allowing one user to change password of other accidentally.

At the end the user can log out from the system using the logout option.

3. About Blood bank:

Here we can see the importance of Blood bank and the use of blood bank and guidelines of the blood bank.

4. Feedback:

Here users or clients can send the feedback to developers.

5. Login:

Here user and Admin can login into the Website. Before login user must register into the website.

6. Make a Blood request:

Here user or others can request a Blood from Admin which group he want with Submitting the details.

7. Registration:

Here user can register before entering the website.

System Development:

The process of building systems has always been complexed with system becoming larger, the costs and complexities get multiplied. So, the need for better methods for developing systems is widely recognized to be effective and the applied model should meet a few basic requirements.

- The model should be structured and cover the entire system development process from feasibility study to programming, testing and implementation.
- The model should utilize established methods and techniques like database designs, normalizations and structured programming techniques.
- The model should consist of building blocks, which define tasks, results and interfaces.
- The model should separate the logical system from the physical system.
- Documentation should be a direct result of the development work and should be concise, precise and as non-redundant as possible.

Based on the above requirements of the system model, system study has been made. Various methodologies have been applied for system study,

evolving design documents, data modeling, input screen design and report design.

Project:

The persons who like to donate blood registers in my site as well as he can modify the details if necessary, giving the Login Id and Password. The persons in need of blood searches for the persons having the same blood group and with in the city. If he found a donor in his city then he gets the total details of the donor, if he doesn't find any donor then he is given the contact numbers and addresses of the Life Saving Contact Persons for major cities. If he doesn't have any chance to contact them then he will be provided with Mobilink Paging Services in order to get the blood.

SYSTEM ANALYSIS

Preliminary Investigation:

First in the system development process is preliminary Investigation. Preliminary Investigation is conducted in the following phases.

- **Project clarification**
- **Feasibility study**
- **Project appraisal**

Project clarification is the process of selecting a project request for further study. When a system development or modification request is made, the first systems activity, the preliminary investigation, begins the activity has three parts: Request clarification, feasibility study and project appraisal. Many requests from employees and users in organization are not clearly stated.

Therefore, before any systems investigation can be considered, the project request must be examined to determine precisely what the originator wants. This is called Request clarification.

As important outcome of the preliminary investigation is the determination that the system request is feasible.

Feasibility Study:

The feasibility study is performed to determine whether the proposed system is viable considering the Technical, Operational and Economical factors. After going through feasibility study, we can have a clear-cut view of the system's benefits and drawbacks.

Technical Feasibility:

The proposed system is developed using Active Server Page, VB Script and HTML as front-end tool and Oracle 8 as the back end. The proposed system needs a Personal Web Server to serve the requests submitted by the users. The Web browser is used to view the web page that is available within the Windows operating system itself. The proposed system will run under Win9x, NT, and win2000 environment. As Windows is very user friendly and GUI OS it is very easy to use. All the required hardware and software are readily available in the market. Hence the system is technically feasible.

Operational Feasibility:

The proposed system is operationally feasible because of the following reasons.

- The customer is benefited more as most of his time is saved. The customer is serviced at his place of work.
- The cost of the proposed system is almost negligible when compared to the benefits gained.

Economic Feasibility:

As the necessary hardware and software are available in the market at a low cost, the initial investment is the only cost incurred and does not need any further enhancements. Hence it is economically feasible.

The system is feasible in all respects and hence it encourages taking up the system design.

Gathering Information:

The analysis through collection of data plays the wider role in the analysis of the system. So, the data is collected at different levels of management to keep track of full information of the system.

The collection of data is done from

Top Level Management

Middle Level Management

Low Level Management

System Study:

Proposed system:

The proposed system, Online Blood Bank site overcomes the drawbacks of the present system. The Blood Bank helps the people who need a blood by giving them overall details regarding the donors with the same blood group and with in their city.

The advantages of the proposed system are listed below.

- The people in need of blood can search for the donors by giving their blood group and city name.
- It is very flexible and user friendly.
- The person's time and work are reduced which very much prevails in the present system.
- Easy and Helpful.
- The people are not limited to receive or provide services in working hours of the branch only; he is serviced 24 hours a day, 7 days of week and 365 days of the year.

Limitation:

- In this project the searching can be done for donors for majority of cities but not for every city.
- In this project the contact person's details are given for the limited cities only.

SYSTEM REQUIREMENTS

Software Environment:

Software Environment is a technical specification of requirement of software product. This specifies the environment for development, operation and maintenance of the product.

Technology used:

-  ASP
-  C#
-  SQL
-  Xml
-  Style sheets
-  HTML
-  Http

HTTP:

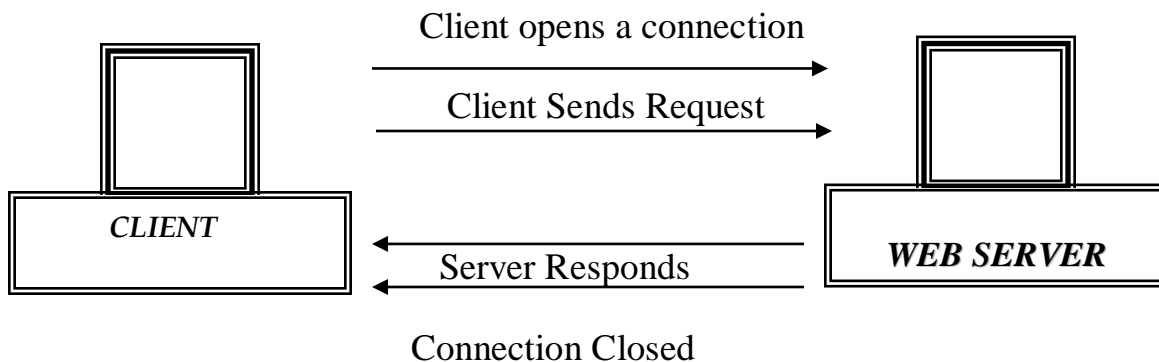

The Hypertext Transfer Protocol is stateless, TCP/IP based protocol used for communicating on the World Wide Web. HTTP defines the precise way Web clients communicate with Web servers. HTTP/1.0 is the most common version in use today. Oddly enough, this protocol is not officially recognized as an Internet standard. It is documented in the informational RFC 1945. Its successor, HTTP/1.1, is currently a proposed Internet standard and many browsers and servers now support this new version.

HTTP Basics:

The HTTP protocol follows a very simple request/response paradigm. In short, a conversation between a Web browser and Web server goes something like this: the client opens a connection to the server, the client makes a request to the server, the server responds to the request, and the connection is closed.

The four stages of a simple Web transaction:

- ❑ The client opens a connection to the server.
- ❑ The client makes a request to the server.
- ❑ The server responds to the request.
- ❑ The connection is closed.

Connectionless Protocol:

HTTP is a connectionless protocol. As you may have guessed, the difference between a connectionless and a connection-oriented protocol is in the way they handle connections. Using a connectionless protocol, the client opens a connection with the server, sends a request, receives a response, and closes the connection. Each request requires its own connection. With a connection-oriented protocol, the client connects to the server, sends a request, receives response, and then holds the connection open in order to service future requests.

The connectionless nature of HTTP is both strength and a weakness. Because it holds a connection open only long enough to service the request, very few server resources are required to service large numbers of users. In fact, many popular Web sites service millions of users in a single day. The drawback to a connectionless protocol is that a connection must be established with every request. Opening a new connection with each request incurs a performance penalty that translates into additional delays for the user.

Alternatively, a connection-oriented protocol such as FTP has a strong performance advantage over a connectionless protocol. This is since the overhead required to open a new connection is incurred only once rather than with every request. Unfortunately, each open connection consumes some amount of server resources. These finite resources, such as memory and disk space, limit the number of concurrent users the server can handle. In contrast to a Web site, an FTP site can rarely support more than a few hundred users at a time.

Stateless Protocol:

As stated in the definition, HTTP is a stateless protocol. A protocol is said to be stateless if it has no memory of prior connections and cannot distinguish one client's request from that of another. In contrast, FTP is a *stateful* protocol, because the connection is not opened and closed with every request. After the initial login, the FTP server maintains the user's credentials throughout the session. On the other hand, due to its stateless nature, there is no inherent method in HTTP for tracking a client's traversal of a Web site. Every connection is a new request from an anonymous client.

The stateless nature of HTTP is both strength and a weakness. It is strength in that its stateless nature keeps the protocol simple and straightforward. It also consumes fewer resources on the server and can support more simultaneous users since there are no client credentials and connections to maintain. The disadvantage is in the overhead required to create a new connection with each request and the inability to track a single user as he traverses a Web site.

Active Server Page 2.0:

What is ASP?

ASP is a server-side software component, used for Server-side Validations for Microsoft Products. This dynamically extends the functionality of a server. Like the way VBScript is used for the making Validations on the client.

Introduction

Since its introduction, the use of Microsoft's Active Server Pages or ASP has grown rapidly. Many programmers consider it the tool for dynamic, easily maintainable web content. The real power of ASP derives firstly from the fact that the html for the page is only generated when the specific page is requested by the user, and secondly from purely html, rather than relying on the browser to support a language or application.

ASP enables us to tailor our web pages to the specific requirements of our users and their browser's type as well as our own needs. It allows us to interact with the user, which helps to keep our site intersection and up to date. Although it is not first technology to offer dynamic page creation, it is one of the fastest and most powerful.

An Active Server Page is a standard HTML file that is extended with additional features. Like a standard HTML file, an ASP contains HTML tags that can be interpreted and displayed by a web browser.

The ASP has three important features. They are

- ✚ An ASP can contain server-side scripts by including server-side scripts in ASP we can create web pages with dynamic context.
- ✚ An ASP provides several built-in objects
- ✚ By using the built-in objects accessible in the ASP, we can make our script much more powerful. Among other things, these objects enable us to retrieve information from and send information to the browsers.
- ✚ An ASP can be included with additional components.
- ✚ ASP comes bundled with several standard, server-side Active-x components. These components enable us to do such things as work with databases, send e-mail, and access the file system.

Hypertext transfer protocol is that handles request and response sent between a web server and browser. The HTTP request is the format of any message sent from the client to a server. It includes the URL of the required resource and information about the client and the platform they are using. The HTTP response can contain a resource, a redirection to another page or site, an error message, etc.

ASP provides its own request and response objects, which enables us to access the information stored in the HTTP request message and response headers respectively. Using these objects, we can check for certificates, read and writes cookies, and gets access to Browser information and forms data.

The relationship between ASP and html can be described as follows:

An Active Server Page is a technology that allows for the programmatic construction of html pages for delivery to the browser.

In other words, with ASP we can write a set of instruction that can be used to generate html and other content just before it is delivered. This makes it a good for html developers, because of its power and flexibility to generate html, and ultimately product more spectacular, interactive personalized and up-to-date web sites.

The increasing integration between the windows operating system, database other Aspects including web services, had a great impact on ASP 3.0. Many more packages, applications and services expose interfaces that enable ASP to utilize them. This increasing complexity, and increased opportunities, means that the destinations between resources on the local system or network and the internet are blurring and we, as developers, must be aware of it.

This increased access to resources means that much of the infrastructure has been built and debugged and if we choose to, we can use

this to our advantage. In fact, everywhere we look, much of the hard work has been done and we are left to concentrate on the business specific implementation of our applications. The popularity of ASP has placed at our disposal a great wealth of expertise. We are also not dependent on Microsoft the prevalence of systems and companies, which use ASP as the core technology, mean that any problems will be resolved quickly, and in fact many of them already have.

Why to Use?

By using Active server pages, we can create web sites with dynamic context. The parameters submitted by a client can be anything registration data, search arguments, customization, anything. Businesses are interested in the information that is stored in databases. This information must be retrieved from a database. The requested information must be extracted from the database when it's requested, encoded in HTML format on the fly and transmitted to the client.

The simplest way to create an ASP page is to change the extension of an existing HTML document from HTML to ASP. Then place the file in a new

SQL:

The name SQL stands for Structural Query Language. SQL is a data access language, like any other language, it is used for communication. SQL communicates with database manager. The database manager could be Oracle, Informix, DB2 and SQL database. SQL is easy to learn. Even though SQL is a computer programming language, it is much simpler than traditional programming language like COBOL, BASIC, FORTRAN or API. This is since SQL is a non-procedural language.

SQL is one of the Oracle facilities. It is important to understand in each case its differences, purpose and place in the Oracle family.

- SQL is the language used to access a relational database, including Oracle.
- SQL May be used with each of the Oracle tools, where access to the database is required.

Overview of SQL:

A database management system requires a query language to enable users to access data. Structured Query Language (SQL – pronounced ‘sequel’) is the language used by most relational database systems.

IBM developed the SQL language in a prototype relational database management system –System R – in the mid-1970s. In 1979, Oracle Corporation introduced the first commercially available implementation of SQL.

Features of SQL:

- SQL is an English-like language. It uses words such as select, insert, delete as part of its command set.
- SQL is a non-procedural language: you specify *what* information you require, not how to get it. In other words, SQL does not require you to specify the access method to the data. All SQL statements use the query optimizer – a part of the RDBMS – to determine the fastest means of retrieving the specified data. This feature makes it easier for you to concentrate on obtaining the desired result.

- SQL processes sets of records rather than a single record at a time. The most common form of a set of records is a table.
- A range of user including DBAs, application programmers, management personnel, and many other types of end users can use SQL.
- SQL provides commands for a variety of tasks including:
 - Querying data
 - Inserting, updating and deleting rows in a table
 - Creating, modifying and deleting database objects
 - Controlling access to the database and database objects
 - Guaranteeing database consistency.

SQL Processing Capabilities:

SQL is composed of a definition language a Data Manipulation Language and a Data Control Language. These three languages support the complete spectrum of Relational Data processing activity. In fact, most SQL based product all access to the data through SQL.

1. Data Definition Language:

DDL allows creation, Deletion and Modification of data structure for bar system. These structures include tables, databases and indexes.

Ex: Create, Drop and Alter.

2. Data Manipulation Language:

These commands are used to manipulate the data in tables directly or through views. There are four standard DML statements. They are select, delete, insert and update.

3. Data control language:

These commands are used to control usage and access of data. The most commonly found one's will include grant, revoke.

HTML:

The extended reach of information and services to customers that the Internet has enabled, has created a new challenge for the developer. The developer should develop a user interface that is distributable, available on multiple platforms and supports a wide range of client environments from handheld wireless devices to high-end workstations. So, to maintain a broad reach to client environments and to achieve greatest compatibility with all browsers, this system uses standard HTML.

Hyper Text Markup Language is the standard language for creating documents for the World Wide Web. An HTML document is a text file, which contains the elements, in the form of tags that a web browser uses to display text, multimedia objects, and hyperlinks using HTML; we can format a document for display and add hyperlinks to other documents.

The user interface has been designed in HTML hence can be browsed in any web browser.

Cascading Style Sheets:

These have been used to separate data from presentation. By using these style sheets throughout the project, a uniform look and feel can be maintained for all the HTML elements and tags that have been used in the project. If there is any revamp the way the content has been presented in the website, the changes can be made to the appropriate style sheet, which will be reflected across all the style sheets.

C#:

C# is a general-purpose, modern and object-oriented programming language pronounced as “C sharp”. It was developed by Microsoft led by Anders Hejlsberg and his team within the .Net initiative and was approved by the European Computer Manufacturers Association (ECMA) and International Standards Organization (ISO). C# is among the languages for Common Language Infrastructure and the current version of C# is version 7.2. C# is a lot like Java syntactically and is easy for the users who have knowledge of C, C++ or Java.

A bit about .Net Framework

.Net applications are multi-platform applications and framework can be used from languages like C++, C#, Visual Basic, COBOL etc. It is designed in a manner so that other languages can use it.

know more about .Net Framework

Why C#?

C# has many other reasons for being popular and in demand. Few of the reasons are mentioned below:

Easy to start: C# is a high-level language so it is closer to other popular programming languages like C, C++, and Java and thus becomes easy to learn for anyone.

Widely used for developing Desktop and Web Application: C# is widely used for developing web applications and Desktop applications. It is one of the most popular languages that is used in professional desktop. If anyone wants to create Microsoft apps, C# is their first choice.

Community: The larger the community the better it is as new tools and software will be developing to make it better. C# has a large community, so the developments are done to make it exist in the system and not become extinct.

Game Development: C# is widely used in game development and will continue to dominate. C# integrates with Microsoft and thus has a large target audience. The C# features such as Automatic Garbage Collection, interfaces, object-oriented, etc. make C# a popular game developing language.

Beginning with C# programming:

Finding a Compiler:

There are various online IDEs such as Geeks for Geeks ide, Code Chef ide etc. which can be used to run C# programs without installing.

Windows: Since the C# is developed within .Net framework initiative by Microsoft, it provides various IDEs to run C# programs: Microsoft Visual Studio, Visual Studio Express, Visual Web Developer

Linux: Mono can be used to run C# programs on Linux.

Programming in C#:

Since the C# is a lot like other widely used languages syntactically, it is easier to code and learn in C#.

Programs can be written in C# in any of the widely used text editors like Notepad++, gedit, etc. or on any of the compilers. After writing the program save the file with the extension .cs.

WORKING ENVIRONMENT

Hardware Configuration:

Processor	:	P III 700 MHz.
RAM	:	64 MB RAM
Hard Disk Drive	:	20 GB HDD
Keyboard	:	104 keys
Mouse	:	Logitech Mouse
Monitor	:	15” digital color monitor
Display Type	:	VGA

Software Configuration:

Operating System	:	Windows 8,9,10
Web server	:	Personal Web Server
Web Browser	:	Internet Explorer / Chrome
Designing Tool	:	Microsoft Visual Studio
Server-Side Scripting	:	ASP.net
Client-Side Scripting	:	C#
Backend	:	SQL

SYSTEM DESIGN

Introduction to System Design:

System design is the process of planning a new system or to replace the existing system. Simply, system design is like the blueprint for building, it specifies all the features that are to be in the finished product.

System design phase follows system analysis phase. Design is concerned with identifying functions, data streams among those functions, maintaining a record of the design decisions and providing a blueprint the implementation phase.

Design is the bridge between system analysis and system implementation. Some of the essential fundamental concepts involved in the design of application software are:

- Abstraction
- Modularity
- Verification

Abstraction is used to construct solutions to problem without having to take account of the intricate details of the various component sub problems. Abstraction allows system designer to make stepwise refinement, which at each stage of the design may hide, unnecessary details associated with representation or implementation from the surrounding environment.

Modularity is concerned with decomposing of main module into well-defined manageable units with well-defined interfaces among the units. This enhances design clarity, which in turn eases implementation, Debugging, Testing, Documenting and Maintenance of the software product.

Modularity viewed in this sense is a vital tool in the construction of large software projects.

Verification is fundamental concept in software design. A design is verifiable if it can be demonstrated that the design will result in implementation that satisfies the customer's requirements. Verification is of two types namely.

- Verification that the software requirements analysis satisfies the customer's needs.
- Verification that the design satisfies the requirement analysis.

Some of the important factors of quality that are to be considered in the design of application software are:

Reliability:

The software should behave strictly according to the original specification and should function smoothly under normal conditions.

Extensibility:

The software should be capable of adapting easily to changes in the specification.

Reusability:

The software should be developed using a modular approach, which permits modules to be reused by other application, if possible.

The System Design briefly describes the concept of system design and it contains four sections. The first section briefly describes the features that the system is going to provide to the user and the outputs that the proposed system is going to offer.

The second section namely Logical Design describes the Data Flow Diagrams, which show clearly the data movements, the processes and the data sources, and sinks, E-R diagrams which represent the overall logical design of the database, and high-level process structure of the system.

The process of design involves “conceiving and planning out in the mind” and making a drawing pattern, or sketch of the system. In software design there are two types of major activities, Conceptual Design and Detailed Design.

Conceptual or logical or external design of software involves conceiving, planning out, and specifying the externally observable characteristics of a software product. These characteristics include user displays, external data sources, functional characteristics and high-level process structure for the product.

Details or internal design involves conceiving, planning out, and specifying the internal structure and processing details of the software product. The goal of internal design is to specify internal structure, processing details, blueprint of implementation, testing, and maintenance activities.

One of the important fundamental concepts of software design is modularity. A modularity system consists interfaces among the units. Modularity enhances design clarity, which in turn eases implementation, debugging, testing, documentation, and maintenance of the software product.

The other fundamental concepts of software design include abstraction, structure, information hiding, concurrency and verification. The

use of structuring permits decomposition of a large system into smaller, more manageable units with well-defined relationships to the other units. The system design is verifiable if it can be demonstrated that the design will result in an implementation that satisfies the customer's requirements.

Preliminary Design:

Preliminary design is basically concerned with deriving an overall picture of the system. Deriving entire system into modules and sub-modules while keeping Cohesion and Coupling factors in mind. Tools, which assist in preliminary design process, are Data Flow Diagrams.

Code design:

The purpose of code is to facilitate the identification and retrieval for items of information. A code is an ordered collection of symbols designed to provide unique identification of an entity or attribute. To achieve unique identification there must be only one place where the identified entity or the attribute can be entered in the code; conversely there must be a place in the code for everything that is to be identified. This mutually exclusive feature must be built into any coding system.

The codes for this system are designed with two features in mind. Optimum human oriented use and machine efficiency. Length of the code range from length of one to length of five characteristics:

- The code structure is unique; ensuring that only one value of the code with a single meaning may be correctly applied to a given entity or attributes.
- The code structure is expansible allowing for growth of its set of entities and attributes.

- The code is concise and brief for recording, communication, transmission and storage efficiencies.
- They have a uniform size and format.
- The codes are simple so that the user can easily understand it.
- The codes are also versatile i.e., it is easy to modify to reflect necessary changes in condition, characteristic and relationships of the encoded entities.
- The codes are also easily storable for producing reports in a predetermined order of format.
- The codes are also stable and do not require being frequently updated thereby promoting user efficiency.
- The codes are also meaningful.
- They are also operable i.e.; they are adequate for present and anticipate data processing both for machine and human use.

Input Design:

Input design is a part of overall system design, which requires very careful attention. The main objectives of input design are:

- To produce a cost-effective method of input.
- To achieve the highest possible level of accuracy.
- To ensure that the input is acceptable to and understood by the user staff.

In this system input screens are designed very carefully so that no inaccurate data will enter the database. The data is made as easy as possible. For simplifying the data entry many facilities are given.

Each screen in this system is facilitated by many pushbuttons so that the user can easily work with this system.

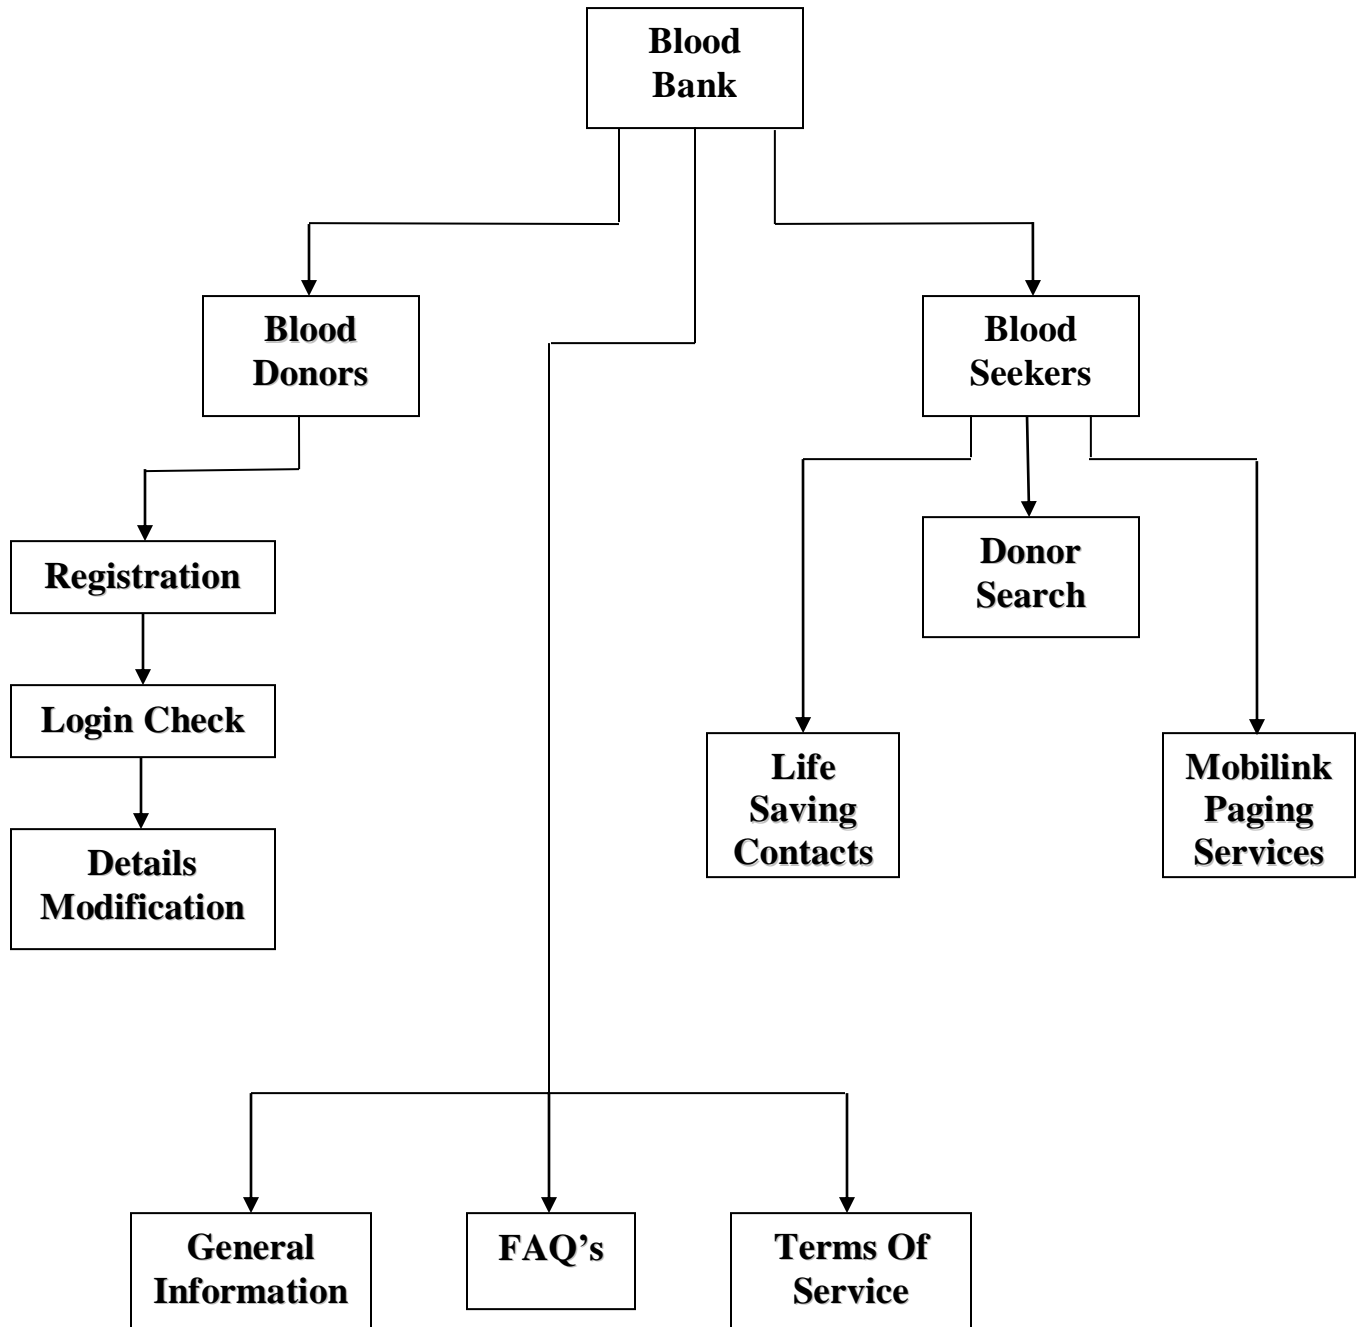

Output Design:

Outputs from computer systems are required primarily to communicate the results of processing to users. They are also to provide a permanent hard copy of these results for later consultation.

The various types of outputs are required by this system are given below:

- External outputs, whose destination is outside the concern and which require special attention because they, project the image of the concern.
- Internal outputs, whose destination is within the concern and which require careful design because they are the user's main interface within the computer.
- Operation outputs, whose use is purely within the computer department.
E.g., program listings, usage statistics etc,
- Interactive outputs, which involves the user in communicating directly with the computers.

DATABASE DESIGN

Database is an integrated collection of data and provides a centralized access to the data and makes possible to treat data as a separate resource. Usually centralized data managing software is called a Relational Database Management System (RDBMS). The most significant difference between RDBMS and other type of Data Management is the separation of data as seen by the program and data as stored on the direct access storage device. This is the difference between logical and physical data.

Data Dictionary:

The efficiency of an application developed using RDBMS mainly depends upon the database tables, the fields in each table and the way the tables are opened using the contents in them to retrieve the necessary information. Hence a careful selection of tables and their fields are imperative.

The database tables used in this system are created keeping the above points in mind. The tables used are given below.

Register Table:

Description: Used to Register the donor information and helpful for the people in need of blood to get details regarding the person with matching blood group and city

Field Name	Field Type	Field Length
Name	Varchar2	20
Addr	Varchar2	30
City	Varchar2	20
Sex	Varchar2	6
Wei	Number	5,3
Dob	Date	
Bgrp	Varchar2	10
Telo	Number	14
Telr	Number	14
Mobi	Number	14
Email	Varchar2	30
Lname	Varchar2	20
Pass	Varchar2	15

Detailed Description:

My project Online Blood Bank is to provide services for the people who need blood by getting help from the donors who are interested in donating blood for the people. This project mainly elucidates the modules such as:

- ❑ Donor Registration
- ❑ Modifying Donor Information
- ❑ Donor Search
- ❑ Life Saving Contacts (in major cities)
- ❑ Mobilink Paging Services

These modules can be explained in detail as follows:

Donor Registration:

In this module, people who are interested in donating blood get registered in my site and give his overall details related to him, i.e. he fills in a registration form by giving the total details such as name, address, city, sex, wt, dob, blood group, telephone numbers, e-mail address, etc. He was also given two fields' username and password to fill such that he was a registered donor and he can enter the login form with his username and password and can modify his details if needed.

Modifying Donor Information:

The registered donor only can modify his details; no other person can modify his details as there was a login form which restricts others from entering the username and password providing high security for the details given by the donor. If at all the donor wants to modify his details, he was

forced to give his username and password to enter in. After giving the username and password it checks for the donor whether he is an existing donor or not and if the username and password matches, he can then able to modify his total details. If the username and password do not exist then he gets a message as 'Wrong ID and Password Entered, Try Again'.

Donor Search:

The people who need blood can search in our site for getting the details of donors having the same blood group and with in the same city. They can directly click on the link search a donor and can select a city name as well as the blood group which he needs. He then gets the details of the donors who exist with in the city and the same blood group that he has selected. If no match was are found for the city and group selected by him, he gets a message 'SORRY DONORS ARE NOT AVAILABE WITH THE FOLLOWING BLOOD GROUP AND AREA'.

Life Saving Contacts:

If at all the people in search of a donor doesn't get any match for their area and group, then they will be provided a service i.e. he will be given a Contact Person details for their near by cities who have the details of many other donors with him. The people in search can call him and can get the details of the donors and can be provided services in this manner. But this life saving contact persons can be available only for a limited number of cities but not for all. These contact persons are the authorized persons of my blood bank.

Mobilink Paging Services:

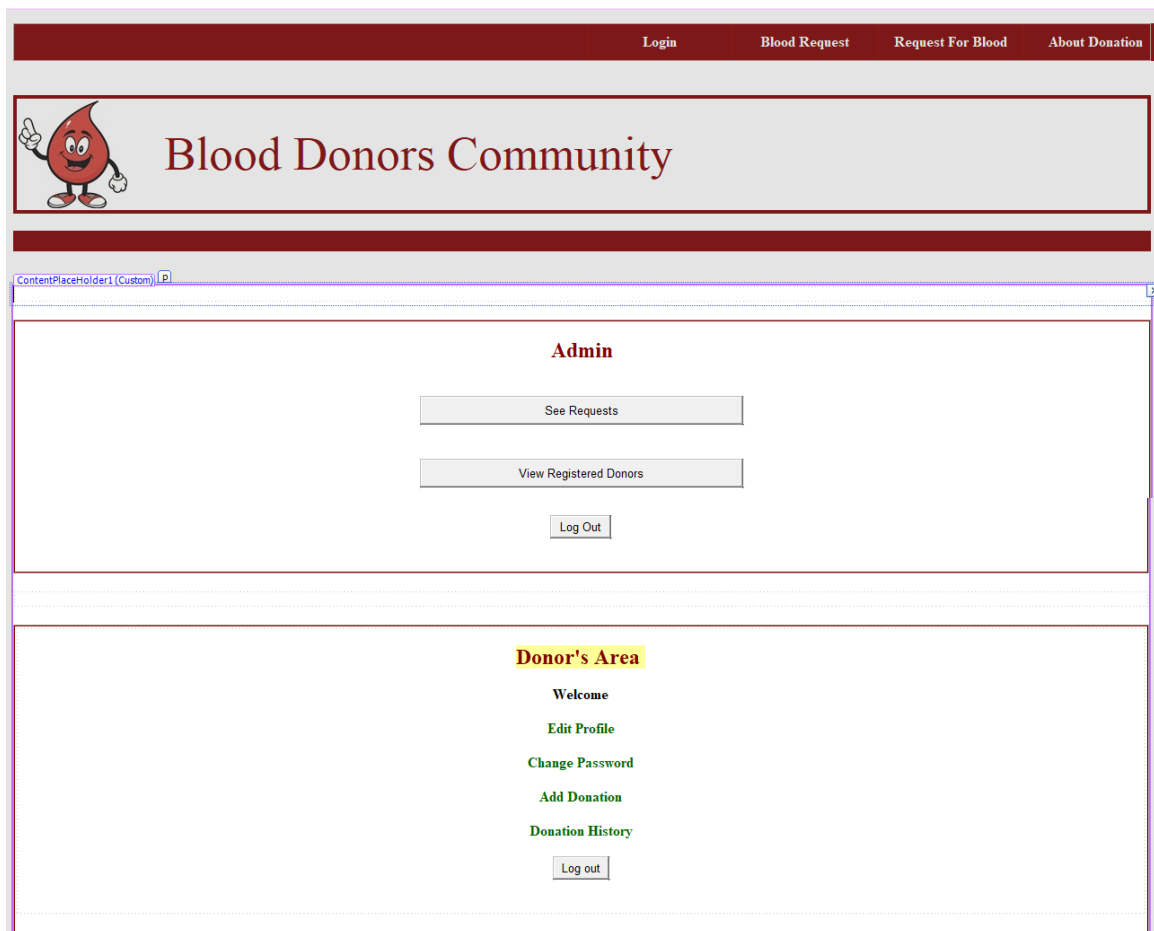

If at all the person in search of blood has found any problem in contacting the life saving contacts i.e. the contact persons, he was provided with a service called 'Mobilink Paging Service'. The person in search of blood was given a 'Mobilink' India's Largest Paging Service number such that the person who was searching can call the paging service number and can tell them the blood group needed and the total details from where they are contacting. Then the 'Mobilink' will broadcast a message on the pagers of their Subscribers displaying the Blood Group required, the Name of the Hospital, Contact Number, Patients Name, etc.

Why Donate Blood?

Donating Blood Saves Lives

Consider the individuals in the hospital needing a blood transfusion. A gunshot or accident victim. Any person needing an ample supply of blood while in surgery. These people need us, and what they ask for is very little. Just imagine what a few pints of blood can do and how many lives it can save.

Donating Blood Increases Your Own Awareness of Cholesterol Levels

One of the added benefits of donating blood is having access to cholesterol levels. Results are readily available to you online so you can gauge what you need to change in your diet, or you may just want to maintain healthy levels.

The Health Benefits from Donating Blood

Donating blood has many health benefits. Not only will you help someone in need of blood, but you will also help optimize your health and wellness. Here are the top three health benefits from donating blood.

1. Protect Your Heart by Reducing Oxidative Stress

Iron in your blood can oxidize resulting in damage to your cells and tissues. The increase in oxidative stress is most dangerous to your cardiovascular system.

According to a new study published by the American Medical Association, giving blood every six months led to fewer heart attacks and strokes in test participants ages 43 to 61.

Excessive iron is thought to contribute to heart disease, especially at its early stages. Donating blood on a regular basis reduces the iron stores in the body and this study supports the theory that reducing iron appears to preserve cardiovascular health.

A second study of 2,682 men in Finland, reported in the *American Journal of Epidemiology*, found that men who donated blood at least once a year had an 88 percent lower risk of heart attacks than non-donors.

This same group of researchers published a follow-up study and found that men who donated blood were less likely than non-donors to show any signs of cardiovascular disease.

2. Protect Against Developing Cancer

Give blood to help lower your risk of cancer. According to the Miller-Keystone Blood Center, consistent blood donation is associated with lowered risks for cancers including liver, lung, colon, stomach and throat cancers.²

Risk levels dropped in correlation with how often participants donated blood. The association between lower cancer risk and donating blood might also stem from reducing oxidative stress. Free radical compounds can damage your DNA. Damaged genetic material is the hallmark of all cancers.

3. Free Blood Analysis

After donating, your blood will be tested for syphilis, HIV (the virus that causes AIDS), hepatitis and other factors. The center will notify you if tests show you may be unhealthy. Your blood will not be used if it could make someone sick.

SYSTEM TESTING

System testing is the stage before system implementation where the system is made error free and all the needed modifications are made. The system was tested with test data and necessary corrections to the system were carried out. All the reports were checked by the user and approved. The system was very user friendly with online help to assist the user wherever necessary.

Test Plan:

A test plan is a general document for the entire project, which defines the scope, approach to be taken, and schedule of testing, as well as identifying the test item for the entire testing process, and the person responsible for the different activities of testing. This document describes the plan for testing, the knowledge management tool.

Major testing activities are:

- ❑ Test units
- ❑ Features to be tested
- ❑ Approach for testing
- ❑ Test deliverables
- ❑ Schedule
- ❑ Personal allocation

Test units:

Test Case specification is major activity in the testing process. In this project, I have performed two levels of testing.

- Unit testing
- System testing

The basic units in Unit testing are:

- Validating the user request
- Validating the input given by the user
- Exception handling

The basic units in System testing are:

- Integration of all programs is correct or not
- Checking whether the entire system after integrating is working as expected.
- The system is tested as whole after the unit testing.

Other Testing Strategies:

Alpha Testing:

This was done at the developer's site by a customer. The software is used in a natural setting with the developer "looking over the shoulder" of the user and recording errors and usage problems. Alpha tests are conducted in a controlled environment.

Beta Testing:

This was conducted at one or more customer sites by the end-user of the software. Unlike alpha testing, the developer is generally not present.

Therefore, the beta test is a “live” application of the software in an environment that cannot be controlled by the developer. The customer records all problems that are encountered during beta testing and reports these to the developer at regular intervals. As a result of problems reported during beta tests, software engineers make modifications and then prepare for release of the software product to the entire customer base.

Test deliverables:

The following documents are required besides the test plan

- Unit test report for each unit
- Test case specification for system testing
- The report for system testing
- Error report

The test case specification for system testing must be submitted for review before the system testing commences.

IMPLEMENTATION AND EVALUATION

During the software-testing phase each module of software is thoroughly tested for bugs and for accuracy of output. The system developed is very user-friendly and the detailed documentation is also given to the user as online help wherever necessary. The implementation phase normally ends with the formal test involving all the components.

The entire system was developed using the ASP, HTML, JavaScript, Personal Web Server, and SQL as back end. The HTML is used to design the web page. The Personal Web Server is used to understand the client's request and to send response to them. The C# or C-Sharp are used for client-side validations so that the user can enter only appropriate input in the input fields. The SQL is the back-end tool where the database resides.

Hence the design of the entire system is user-friendly and simple the implementation has been quite easy.

CONCLUSION

This project has given me an ample opportunity to design, code, test and implements an application. This has helped in putting into practice of various Software Engineering principles and Database Management concepts like maintaining integrity and consistency of data. Further, this has helped me to learn more about SQL, ASP 2.0, HTML, C# and Personal Web Server.

I thank my guide for his invaluable contribution in guiding me through out the project. I also thank my parents and friends who have supported and motivated me to complete this project successfully.

Extensibility:

The other features, which the Blood bank services provide, can also be incorporated into this Blood Bank. The Encryption standards can also be used to make the transactions more secure. The Socket Secure Layer protocol can also used in implementing the system, which gives highest security in the Internet.

Future Enhancement:

As there was a little number of contact person's information given, some people may face difficulty in getting blood fast. So i like to gather more information regarding the contact persons in other cities as well as villages and will provide much more services for the people and help everyone with humanity.

***** THANK YOU *****
